The boring deck is dead.
One file killed it.
Real animation, video, live charts and web-grade design, all in one HTML file that's the document, the editor and the player at once. Drop in a tired PowerPoint and let AI rebuild it for the

About

Bento Page is a presentation app and AI image generator-adjacent deck builder built around a single-file model: each deck is one self-contained HTML file. That file holds the document, viewer, editor, and readable JSON data together, so you can edit, share, and open it without an account or cloud dependency. It is designed for local-first use, works offline, and supports end-to-end-encrypted live collaboration.

What is Bento Page

Bento Page is a presentation app for creating office-style documents as a single HTML file. The core idea is simple: one Bento Page deck contains the content, the editor, the

describes itself as local-first and AI-native, with no account required and no cloud storage required for basic use.

This single-file presentation app is aimed at people who want a deck that remains readable and portable instead of trapped in a proprietary package. The page says the file includes a human-readable JSON block at the top, while the rest of the document carries the interactive experience. That means the Bento Page model is not just a viewer for slides; it is also a file format and an editing surface in one.

The product currently focuses on slides. The site also says spaces for notes and dash for sheets and tables are coming soon, so those parts are not available to rely on yet.

Key features

Bento Page combines a single-file presentation app with a web-first workflow that stays inside one HTML file.

- **One file per deck:** each deck is a complete HTML document, so the deck itself is the app.
- **Readable structure:** the file stores data in a JSON document that can be opened in a text editor.
- **Local-first editing:** content is designed to live on your device instead of requiring a hosted workspace.
- **Offline forever:** the site says the app works offline and keeps working without a connection.
- **No account, no cloud:** you can try it without signing up.
- **AI-assisted rebuilds:** the app can take a tired PowerPoint and rebuild it for the modern web, then let you refine the result in the editor.
- **Real web media:** it supports animation, video, live charts, and web-grade design inside the deck.
- **Encrypted live collaboration:** the site explicitly mentions end-to-end-encrypted collaboration.
- **Embedded fonts and assets:** typefaces, images, and charts travel with the file so the deck should look consistent across machines.

Because this is a single-file presentation app, the portability story is part of the product, not an extra export step. A Bento Page deck can be emailed, AirDropped, or archived as one complete unit.

How to use it

- Open Bento Page in your browser and try the live app.
- Start from a template in the gallery or open the sample deck.
- Let the AI rebuild a PowerPoint if you want a faster starting point.
- Edit the deck directly in the browser using the built-in editor.
- Save the result as one HTML file when you are done.
- Share that file by email, file transfer, or any other ordinary method.

If you want to use Bento Page as a single-file presentation app for repeat work, the workflow is meant to stay simple: open, edit, save, and resend the same deck. The site also offers a download option for one file, which matches the local-first model.

Who it is for

Bento Page is a good fit for people who care about editable files, web-native presentation design, and offline access.

- Product teams that need a portable deck they can inspect and reuse.
- Founders and marketers who want a presentation app with AI help and modern visuals.
- Designers who want animation, embedded media, and sharper web-style layouts.
- Teams that prefer local-first tools over cloud-only slide software.
- Anyone who wants a single-file presentation app that can be archived long term.

It is especially relevant if you dislike exports that break formatting or depend on a login to reopen later. Bento Page is built around the idea that the deck should remain the source of truth.

What to know before you use it

Bento Page is not an all-purpose office suite yet. The site says slides are available now, while notes and sheets/tables are still coming, so do not expect a full replacement for a mature document suite.

There are a few practical caveats to keep in mind:

- The app's claims about offline use and long-term portability come from the product site; you should still test your own deck in your own environment before relying on it for a high-stakes event.
- AI rebuilds can speed up the first draft, but you should review layout, wording, and visual accuracy before presenting.
- End-to-end-encrypted collaboration is useful, but any collaboration workflow still depends on your chosen sharing method and team habits.
- A single HTML file is convenient, but complex media, custom fonts, or large assets may affect file size and performance.
- For formal legal, financial, or compliance presentations, keep an official source copy of the underlying material rather than trusting the deck alone.

In short, Bento Page is a single-file presentation app for people who want a deck that behaves like a document and a web app at the same time. If that model fits your workflow, try the app, inspect the file, and see whether the Bento Page approach matches how you build and share slides.

FAQ

What is Bento Page?

Is Bento Page free to use?

Does Bento Page work offline?

What platform does Bento Page run on?

Can Bento Page open PowerPoint files?

What platforms does Bento Page support?

Who should use Bento Page instead of traditional slide software?

Who is Bento Page best for?

Does Bento Page support notes and spreadsheets yet?
